Outline

- Refining our Epic
- PSIP: Productivity and Sustainability Improvement Planning

More on Epic, Story, Task

Definition of Done

Refining Issues

Agile Estimation

Epic, Story, Task Review

- Break down and refine when and as needed
 - Close to when the work will be done
 - Only for work that will take place
 - Can be valuable for estimating
 - There is no "correct" level of granularity
- Epics are very high level objectives
- Stories should represent an increment of value to the customer
 - "Definition of Done" understandable to user
- Tasks are the steps necessary to complete a story
 - May not individually provide value to the customer

Definition of Done

- Simplified definition: When all acceptance criteria are met
- Acceptance criteria
 - "Conditions that a software product must satisfy to be accepted by a user, customer or stakeholder." – Microsoft Press
 - "Pre-established standards or requirements a product or project must meet."
 - Google
 - Can include functional, non-functional, and performance requirements.

Definition of Done

- Important to establish for a story before estimating or beginning a task
- Defined by the team, acceptable to customer
 - Customer language
- Should not specify an implementation unnecessarily

Refining Our Epic

- Epic: Refactor code for enhanced modularity
 - Description: The heat equation code needs refactoring to improve modularity.
 Specifically, there are utilities that could be generalized and used with for other applications. Also, the integration function is currently hard-coded. In the future, we want to use alternative integration functions, so we should generalize the interface for this function.
 - Story 1: Separate out utilities
 - Definition of Done
 - Task list
 - Story 2: Separate out integration function
 - Definition of Done
 - Task list

Refining Our Epic

- Story 1: Separate out utilities
 - Definition of Done
 - Unit tests pass
 - Code review completed
 - Integration/system tests pass
 - Utility performance is at least 95% of pre-separation performance
 - Utility usability demonstrated outside of heat equation application
- Story 2: Separate out integration function
 - Task 1: Add testing for integration function to protect functionality during refactor
 - Needed testing should be specified
 - Task 2: Generalize interface to allow alternative implementations
 - Task 3: Expose current integration function through the new interface & run tests

Agile Estimation

- Estimating is hard
 - Requires practice
 - With practice, it is still hard
- Stories are estimated using "story points"
 - Relative estimate
 - Many estimating techniques
 - Should NOT map to hours, days, etc
 - Definition of done needed, tasking not required
- Tasks are estimated in hours
 - Absolute estimate
- Useful for planning schedules

Key concept:

It is easier to accurately estimate many small tasks than to estimate a large epic.

Epic: Huge refactor effort

Tasks:

- Add tests
- Generalize interface
- Expose existing interface

How To Get Better

"Use iteration and incrementation only for projects you want to succeed."

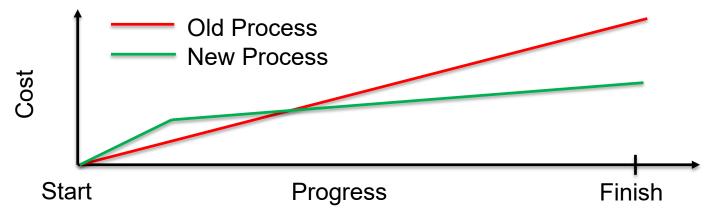

- Adaptation of Martin Fowler quote

Strategy for Incremental Productivity Improvements

- Identify, analyze, prototype, test, revise, deploy. Repeat.
- Realistic: There is a cost.
 - Startup: Overhead
 - Payoff: Best if soon, clear

- Working model:
 - Reserve acceptable time/effort for improvement.
 - Improve how you do your work on the way to getting it done.
 - Repeat.

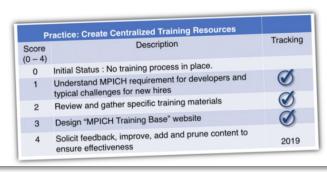

Productivity and Sustainability Improvement Planning (PSIP) Examples: EXAALT & MPICH – Add PSIP URL

MPICH PSIP: Onboarding new team members

PSIP workflow helps a team create user stories, identify areas for improvement, select a specific area and topic for a single improvement cycle, and then develop those improvements with specific metrics for success.
